

## Using weights to handle digit preference (Old Faithful data)

---

Digit preference in Old Faithful geyser data

Using weights to remedy digit preference in Old Faithful eruption times. Uncertain nightly observations have been rounded to exactly 2 and 4 minutes. These bins have been given zero weights. Optimal  $\log_{10}(\lambda) = -0.8$  determined by AIC. Cubic B-spline basis with 20 segments and third order penalty. R code in `f-geyser-weights.R`

```
# Use weights to handle digit preference (Old Faithful geyser data)
# A graph in the book 'Practical Smoothing. The Joys of P-splines'
# Paul Eilers and Brian Marx, 2019

library(ggplot2)
