

## Density estimation with digit preference (Old Faithful geyser data)

---

Digit preference in Old Faithful geyser data

Digit preference in Old Faithful eruption times. Uncertain nightly observations have been rounded to exactly 2 and 4 minutes. Optimal  $\log_{10}(\lambda) = -1.5$  determined by AIC. Cubic B-spline basis with 20 segments and third order penalty. R code in f-geyser-with-DP.R

---

```
